

zhongzero

记录数据:

ins-queue: <sup>指令</sup> inst, <sup>指令类型</sup> ordertype, pc, jumppc

RS: inst, ordertype, pc, jumppc, vj, vk, qi, qk, A, <sup>(immediate)</sup> reorder, <sup>是否被占用</sup> busy

SLB: inst, ordertype, pc, vj, vk, qi, qk, A, reorder, <sup>是否可以开始 store</sup> ready

RoB: inst, ordertype, pc, jumppc, <sup>需要修改的寄存器值</sup> dest, <sup>是否分支预测跳转</sup> value, isjump

register: <sup>值</sup> reg, <sup>是否最新状态</sup> reorder, busy

BHT <sup>用于分支预测</sup> [inst, SLB] 强不跳 / 弱不跳 / 弱跳 / 强跳

五大模块

Get-ins-to-queue(): 读取指令到 ins-queue

do-ins-queue():  $\rightarrow$  RoB,  $\rightarrow$  RS,  $\rightarrow$  SLB

do-RS(): 查看是否有更新 (reg/commit 了 RoB),  $\rightarrow$  RoB

do-SLB():  $\rightarrow$  RoB,  $\rightarrow$  memory  
查看是否有更新 (load data from memory)  
查看是否有更新 (store data from register / store ready 状态 from RoB)

RoB(): 查看队头  $\rightarrow$  register,  $\rightarrow$  SLB,  $\rightarrow$  all (remake)

一般计算: LUI, AUUIPC, ADD, SUB, SLL, SLT, SLTU, XOR, SRL, SRA, OR, AND, ADDI, SLTI, SLTIU, XORI, ORI, ANDI, SLLI, SRLI, SRAI

branch:  $\rightarrow$  有条件: BEQ, BNE, BLT, BGE, BLEU, BGEU  
 $\rightarrow$  无条件: JAL  
 $\rightarrow$  带延迟: JALR

load: LB, LH, LW, LBW, LHW

store: SB, SH, SW
